It is indisputable that human activities are causing climate change, making extreme climate events, including heat waves, heavy rainfall, and droughts, more frequent and severe.

INTERGOVERNMENTAL PANEL ON CLIMATE CHARGE

Climate change is already affecting every region on Earth, in multiple ways.

The changes we experience will increase with further warming.

INTERGOVERNMENTAL PANEL ON CLIMATE CHARGE

Figure SPM.3

Climate change is already affecting every inhabited region across the globe, with human influence contributing to many observed changes in weather and climate extremes

a) Synthesis of assessment of observed change in **hot extremes** and confidence in human contribution to the observed changes in the world's regions

Type of observed change

Increase (41)

in hot extremes

Decrease (0)

Low agreement in the type of change (2)

Limited data and/or literature (2)

Confidence in human contribution to the observed change

- ••• High
- •• Medium
 - Low due to limited agreement
 - Low due to limited evidence

Figure SPM.3

Climate change is already affecting every inhabited region across the globe, with human influence contributing to many observed changes in weather and climate extremes

b) Synthesis of assessment of observed change in heavy precipitation and confidence in human contribution to the observed changes in the world's regions

Type of observed change

in heavy precipitation

Decrease (0)

Increase (19)

Low agreement in the type of change (8)

Limited data and/or literature (18)

Confidence in human contribution to the observed change

••• High

- Medium
- Low due to limited agreement

Low due to limited evidence

INTERGOVERNMENTAL PANEL ON CLIMATE CHANGE

Figure SPM.3

Climate change is already affecting every inhabited region across the globe, with human influence contributing to many observed changes in weather and climate extremes

c) Synthesis of assessment of observed change in **agricultural and ecological drought** and confidence in human contribution to the observed changes in the world's regions

Type of observed change

in agricultural and ecological drought

- Low due to limited agreement
- Low due to limited evidence

INTERGOVERNMENTAL PANEL ON CLIMATE CHANGE

Image source: NASA, NYTimes

Also other impacts and compound events have increased as a result of human activities

IPCC INTERGOVERNMENTAL PANEL ON CLIMATE CHARGE

Figure SPM.5

a) Annual mean temperature change (°C) at 1 °C global warming

Warming at 1 °C affects all continents and is generally larger over land than over the oceans in both observations and models. Across most regions, observed and simulated patterns are consistent.

With every increment of global warming, changes get larger in regional mean temperature, precipitation and soil moisture

b) Annual mean temperature change (°C) relative to 1850-1900

Simulated change at 1.5 °C global warming

Observed change per 1 °C global warming

Simulated change at 1 °C global warming

Across warming levels, land areas warm more than oceans, and the Arctic and Antarctica warm more than the tropics.

Simulated change at 2 °C global warming

Simulated change at 4 °C global warming

0 0.5 1 1.5 2 2.5 3 3.5 4 4.5 5 5.5 6 6.5 7 \cdots

Change (°C) Warmer

INTERGOVERNMENTAL PANEL ON CLIMATE CHARGE

With every increment of global warming, changes get larger in regional mean temperature, precipitation and soil moisture

Figure SPM.5

c) Annual mean precipitation change (%) relative to 1850-1900

Simulated change at 1.5 °C global warming

Precipitation is projected to increase over high latitudes, the equatorial Pacific and parts of the monsoon regions, but decrease over parts of the subtropics and in limited areas of the tropics.

Simulated change at 2 °C global warming

Simulated change at 4 °C global warming

Relatively small absolute changes may appear as large % changes in regions with dry baseline conditions

1000

6

Projected changes in extremes are larger in frequency and intensity with every additional increment of global warming

[Credit: Shari Gearheard | NSIDC

There's no going back from some changes in the climate system. However, some changes could be slowed and others could be stopped by limiting warming.

Emissions scenarios as tools to understand our global futures

a) Future annual emissions of CO₂ (left) and of a subset of key non-CO₂ drivers (right), across five illustrative scenarios

IOCC

INTERGOVERNMENTAL PANEL ON Climate change

WMO UNEP

The proportion of CO₂ emissions taken up by land and ocean carbon sinks is smaller in scenarios with higher cumulative CO₂ emissions

Total cumulative CO₂ emissions taken up by land and oceans (colours) and remaining in the atmosphere (grey) under the five illustrative scenarios from 1850 to 2100

Fo Imit global warming, strong, rapid, and sustained reductions in CO₂, methane, and other greenhouse gases are necessary.

This would not only reduce the consequences of climate change but also improve air quality.

INTERGOVERNMENTAL PANEL ON CLIMATE CHANGE

Future emissions cause future additional warming, with total warming dominated by past and future CO₂ emissions

a) Future annual emissions of CO₂ (left) and of a subset of key non-CO₂ drivers (right), across five illustrative scenarios
